

GTM

single flank inspection - hobbing machine

SOLUTION BY GEARTEC.CZ, 2016

Why single flank testing?

Quality problems in building of new machines

Quality problems in retrofiting of old machines

Problems with quality of gears

Diagnostic of the manufacturing process

Hob instrument and quality of gear

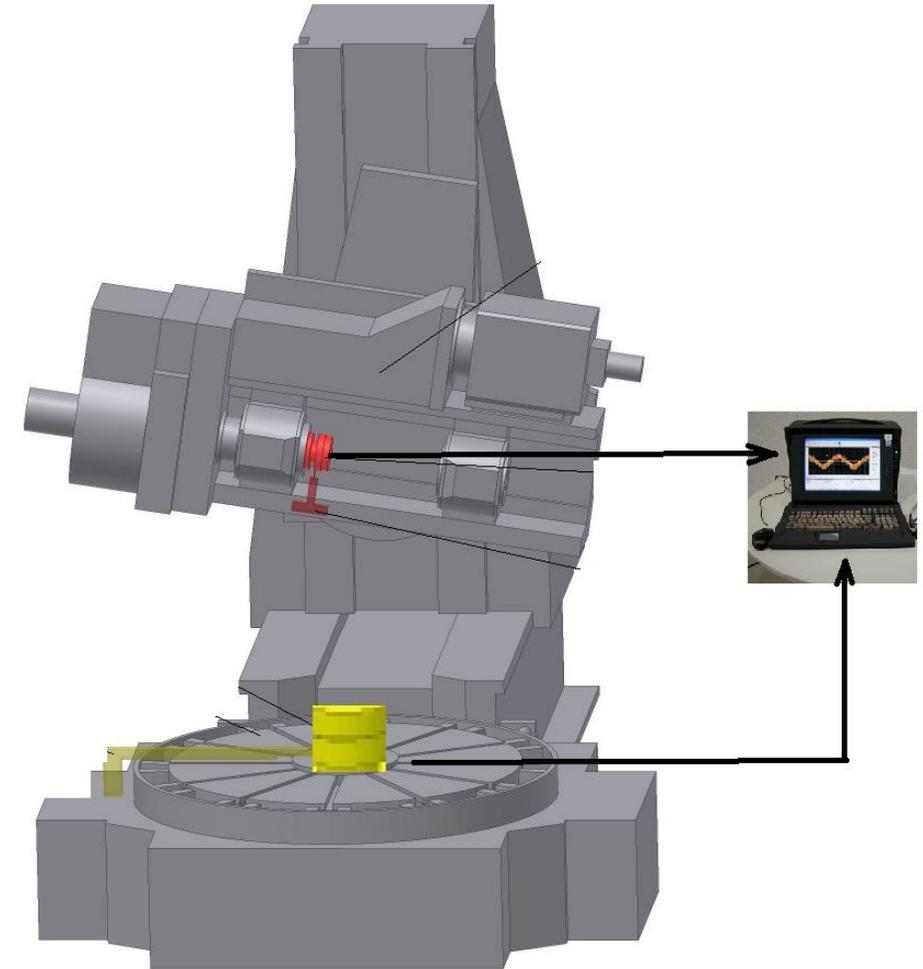

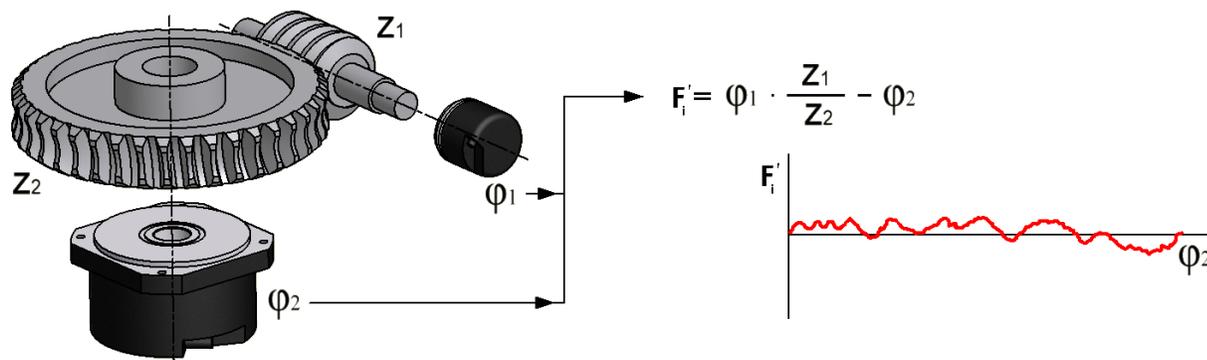

Clamping and quality of gear

Change gears and quality (classical machine)

In all these cases,
the device **GTM**
will help

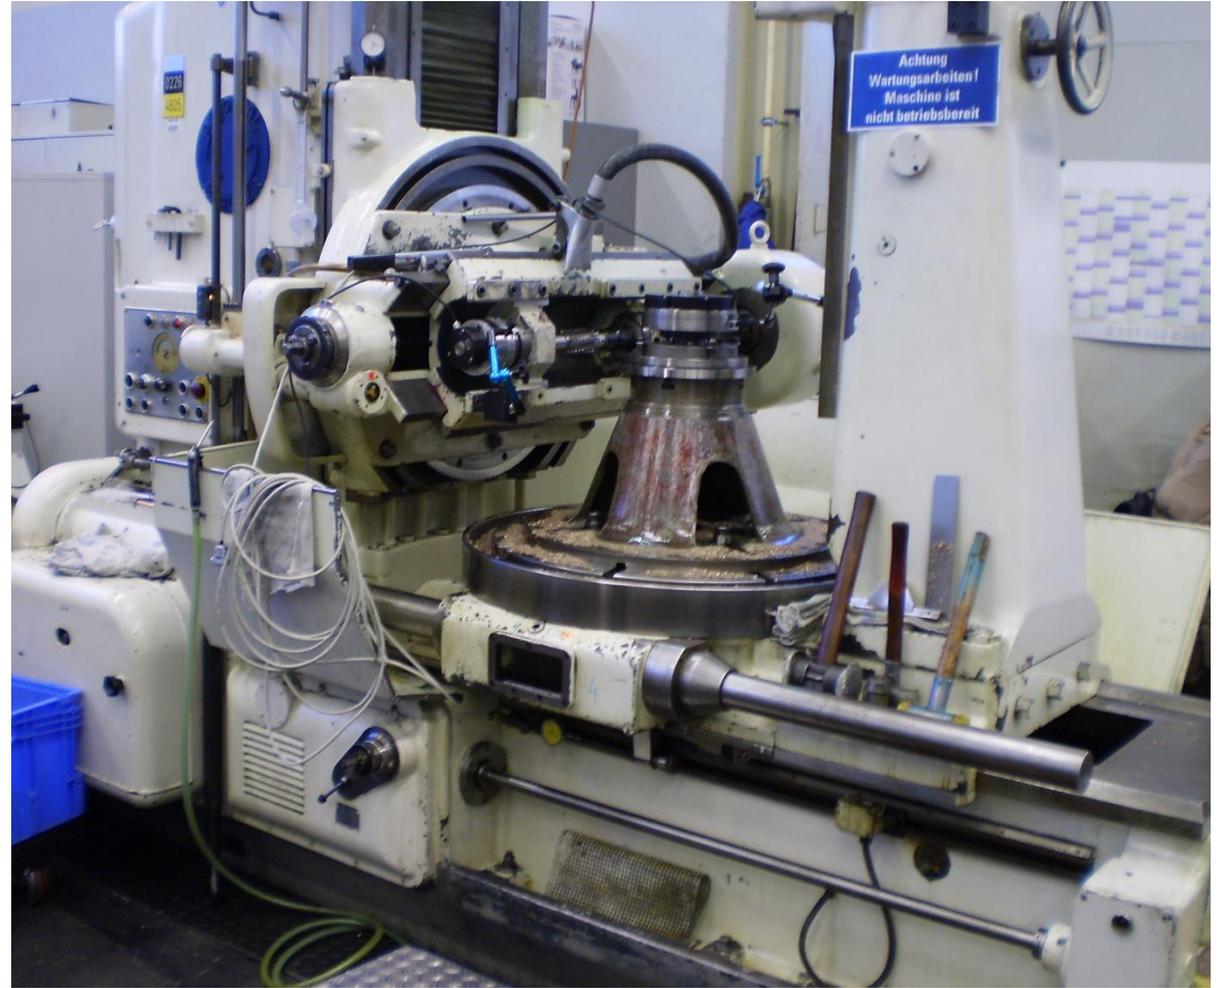

Principle of single flank testing

- measurement directly on the machine
- left and right flanks are tested separately
- two high-accurate angle encoders
- accuracy up to 1 arcsec (5 micro rad) ~ 1 μm on radius of 200 mm
- results in transmission error
- deviation and tolerance according to DIN 3974 Standard

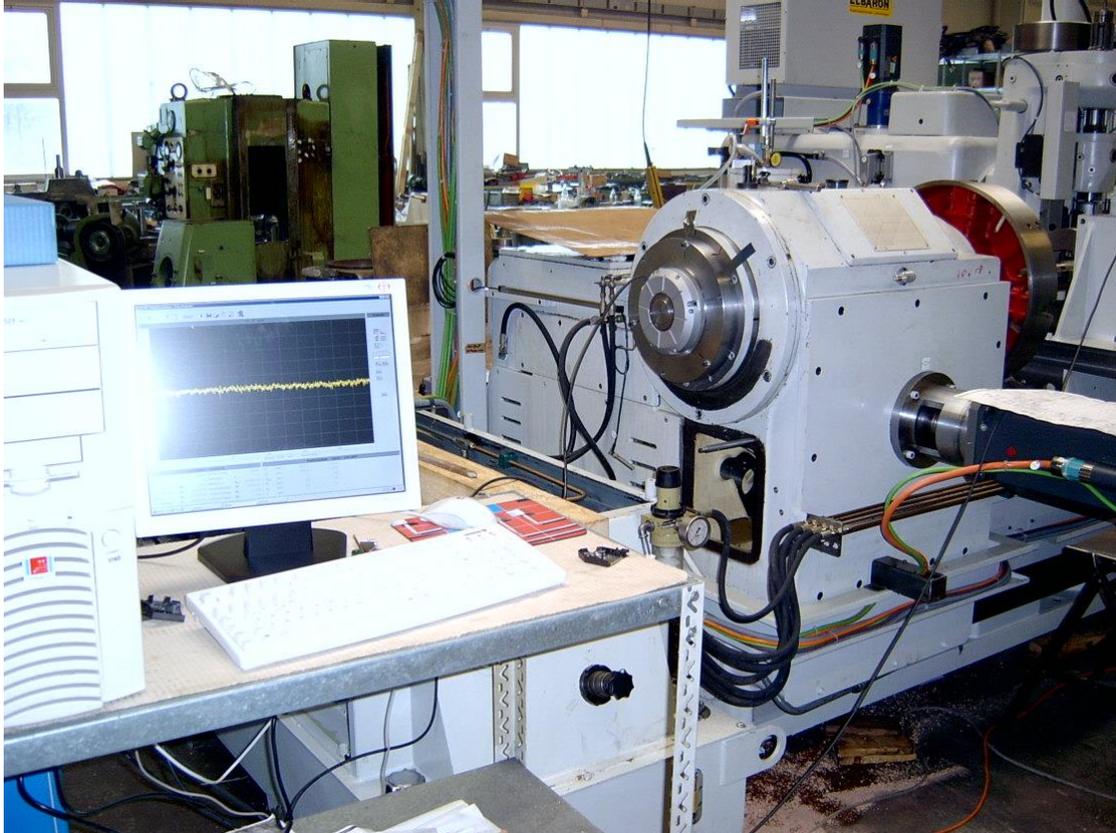

Measurement of very old Pfauter machine

- before disassembling DIN9
- after retrofit DIN6

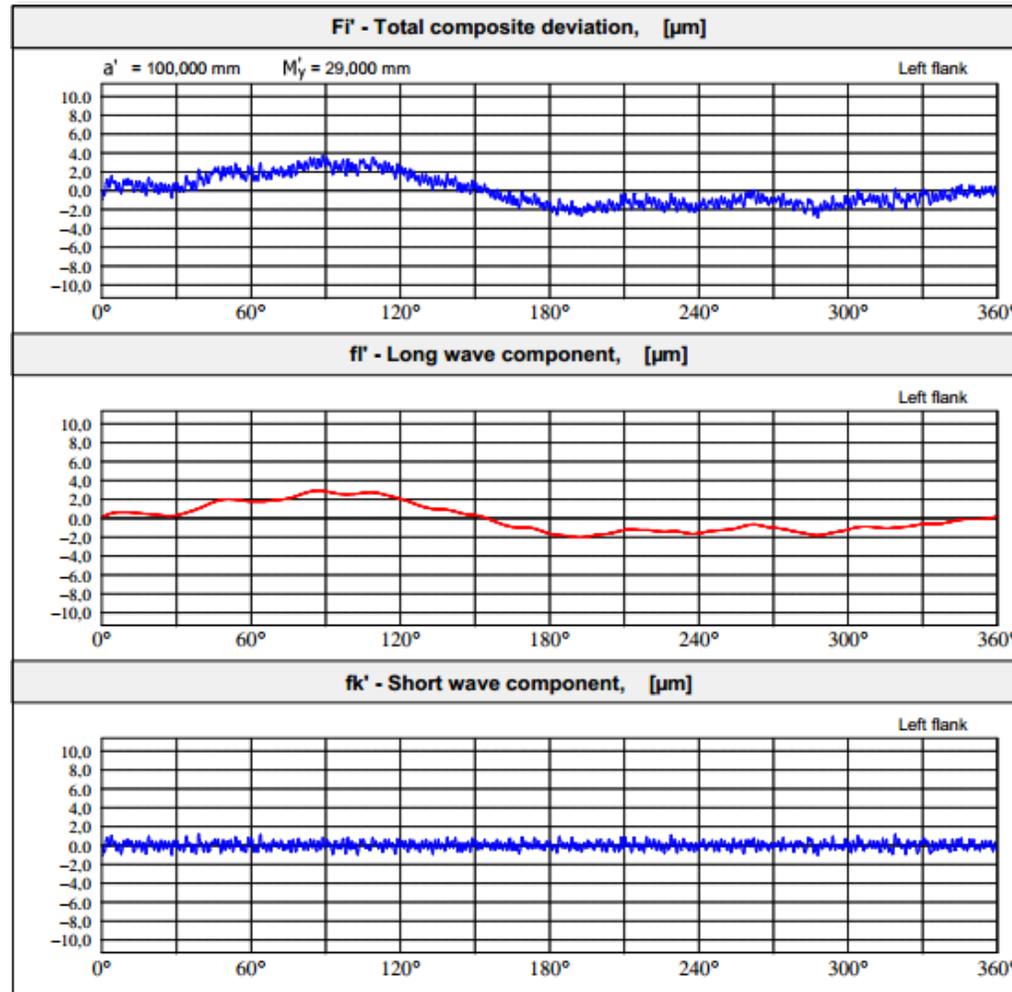

Vertical CNC machine

Hoffler 3000 machine

Inspection report - results of measurement

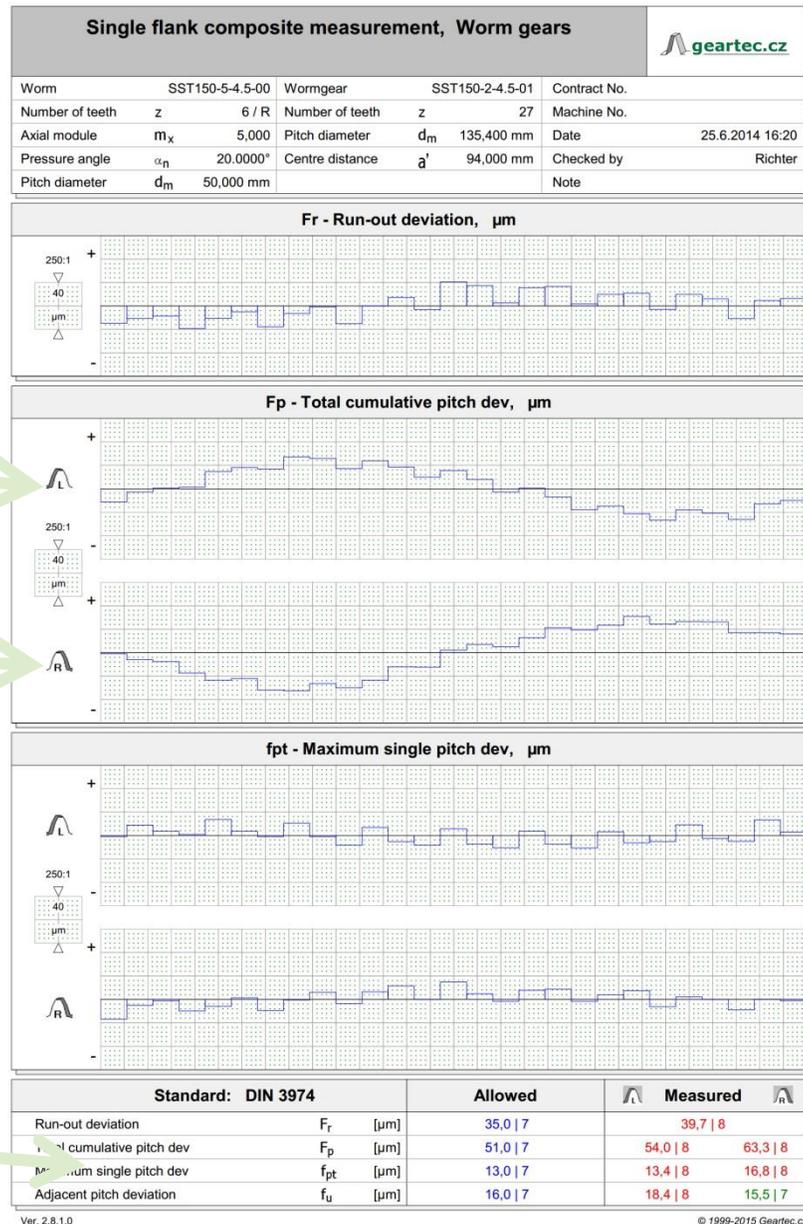

← Deviation $F_i' + f_i'$

← Deviation f_l'
can be eliminated

← Deviation f_k'

Pitch error

Left flank

Right flank

Evaluation

Runout (F_r)

Total pitch error (F_p)

Single pitch error (f_{pt})

Inspection report (evaluation)

Standard

Deviation in μm

DIN - Quality

Standard: DIN 3974	F-factor 25%	Allowed	 Measured 
Total composite deviation	F'_i [μm]	17.8 3	11.3 2 10.9 2
Single flank composite dev.	f'_i [μm]	6.7 3	4.4 2 5.6 3
Mean value	$f'_{i,m}$ [μm]		3.5 1 4.4 2
Max value	$f'_{i,max}$ [μm]		4.6 2 6.8 4
Long wave component	f'_l [μm]	10.0	7.1 6.3
Short wave component	f'_k [μm]	5.0	4.2 5.1
Backlash - tangential	j [mm]		

Ver. 2.6.9.1

Measured values

Input parameters – measurement

Measuring parameters

Basic parameters | Complementary I | Complementary II | Tolerances | Roundness | Setup

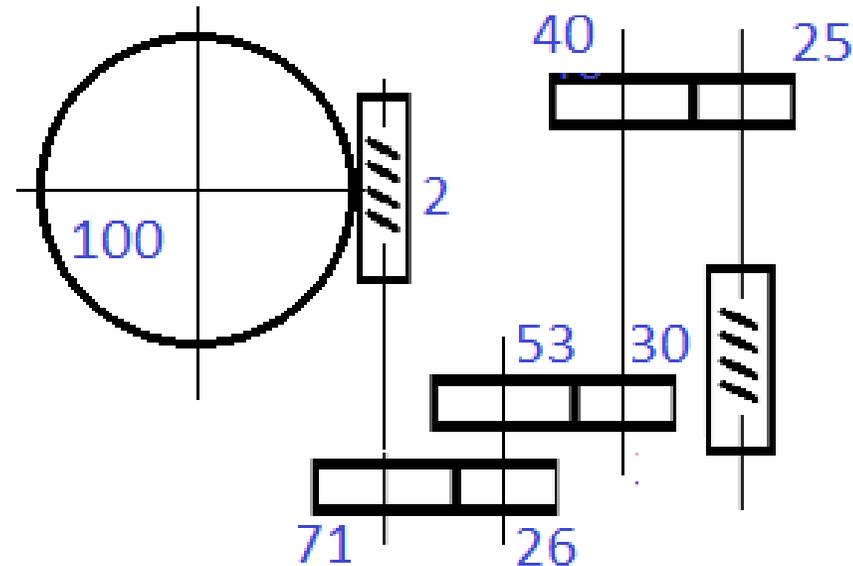

Designation: FO 75

Speed: 4

	Input grade	Output grade	Modul
1st stage	z_1 25	z_2 40	m 2,500
2nd stage	z_1 30	z_2 53	m 2,000
3rd stage	z_1 26	z_2 71	m 2,000
4th stage	z_1 2	z_2 100	m 3,200

Measuring software to control the machine has been developed by GEARTEC.CZ company. It is a window-based application which is user-friendly and very intuitive.

Measurement method – table / CNC machine

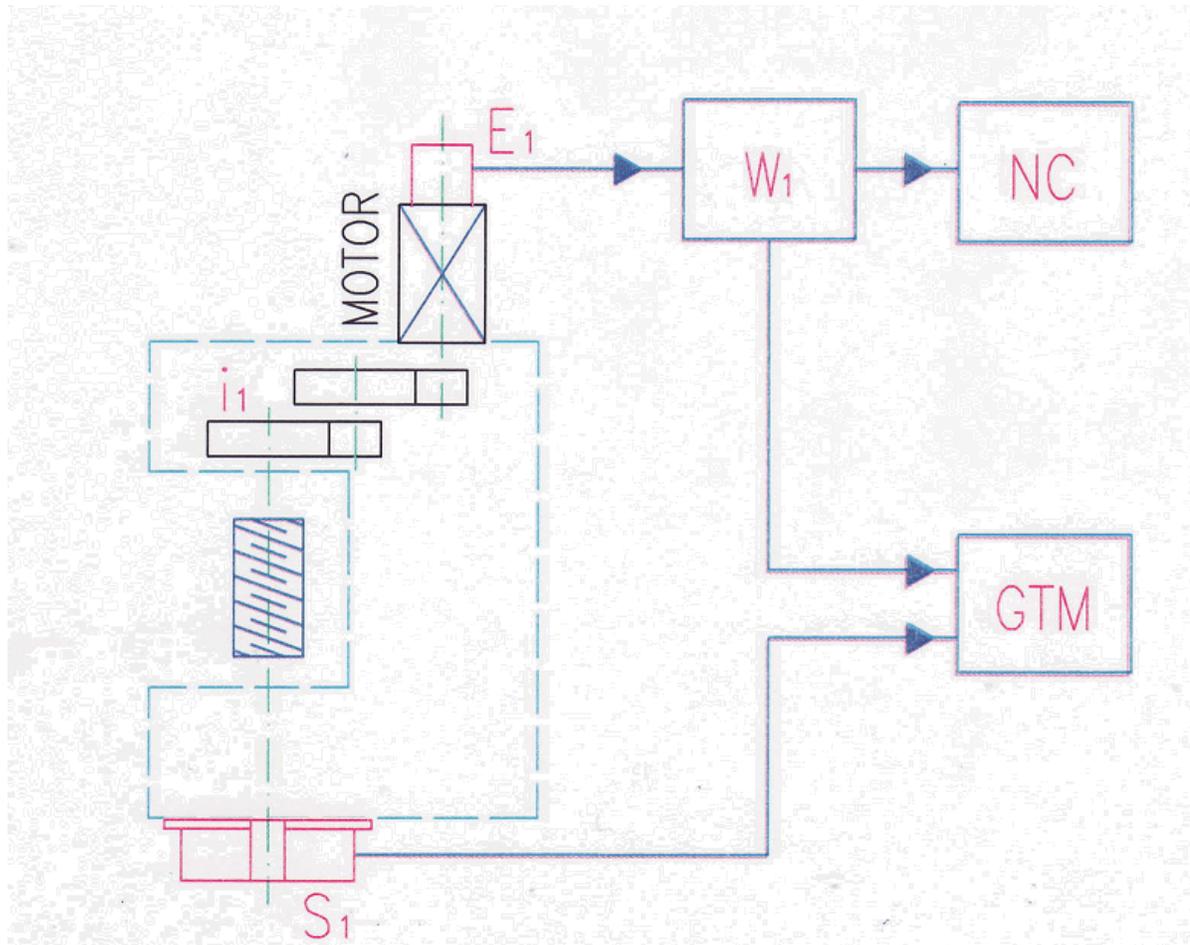

S₂ – high accuracy encoder / GTM

E₂ – rotary encoder / motor

W₂ – electronic switch / GTM fch

Measurement method – hob axis / CNC machine

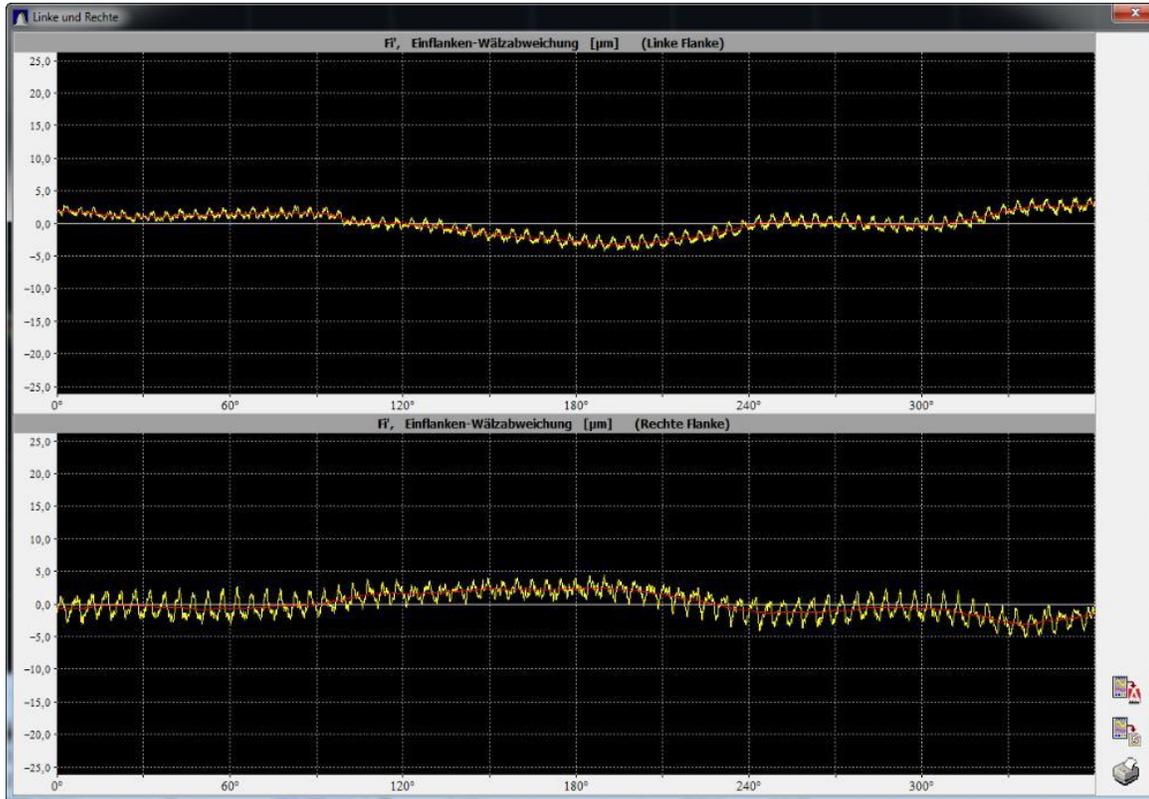

S1 – high accuracy encoder / GTM

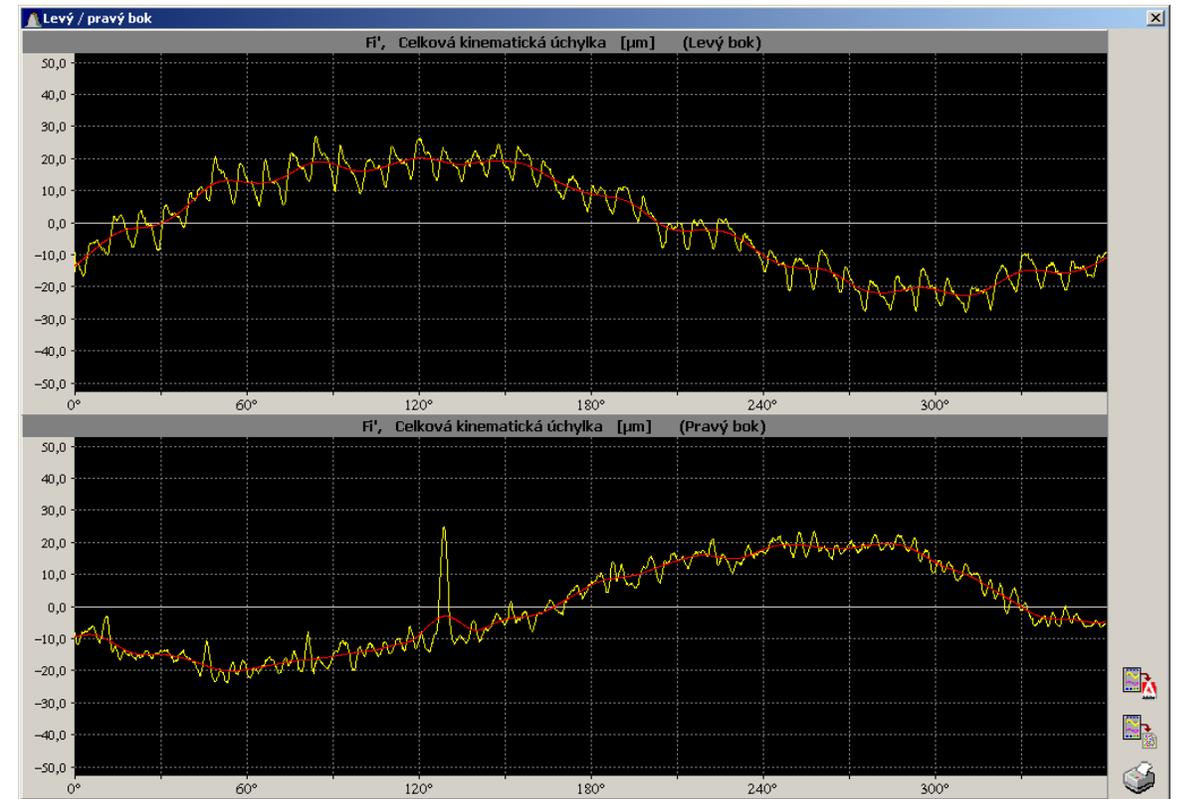

E1 – rotary encoder/ motor

W1 – electronic switch / GTM fch

Measuring software – examples of charts

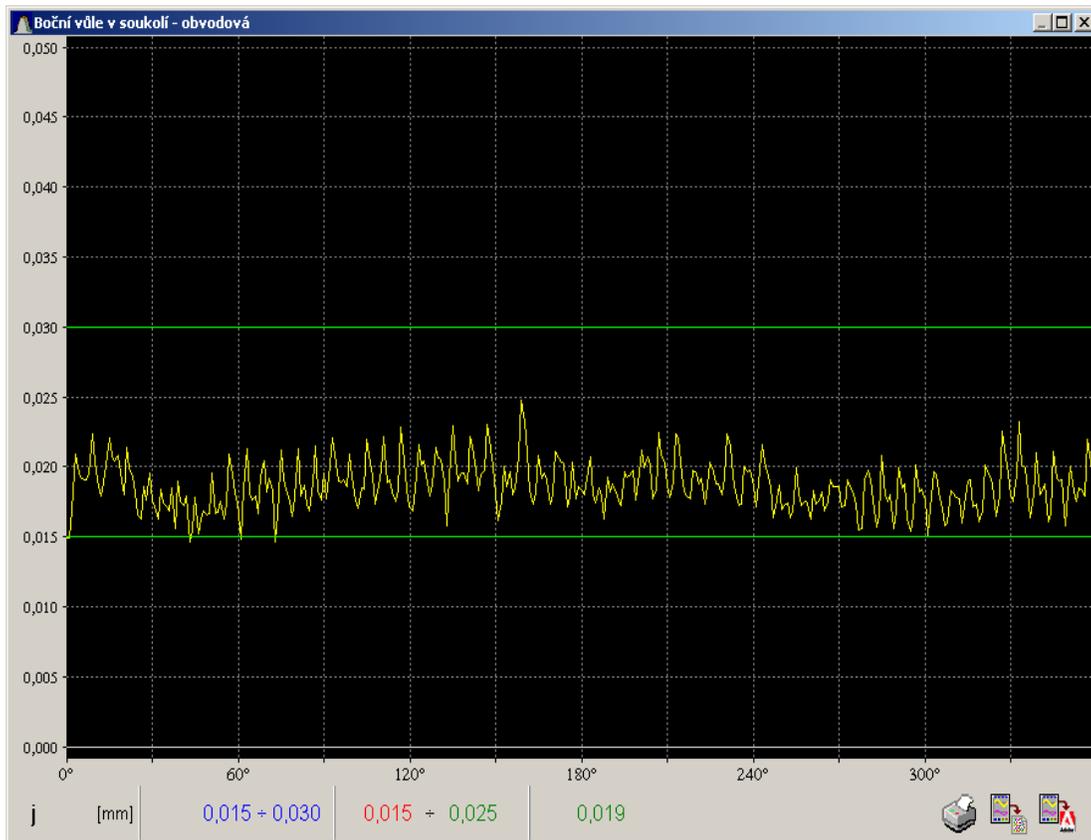

➤ Machine in very **good** condition

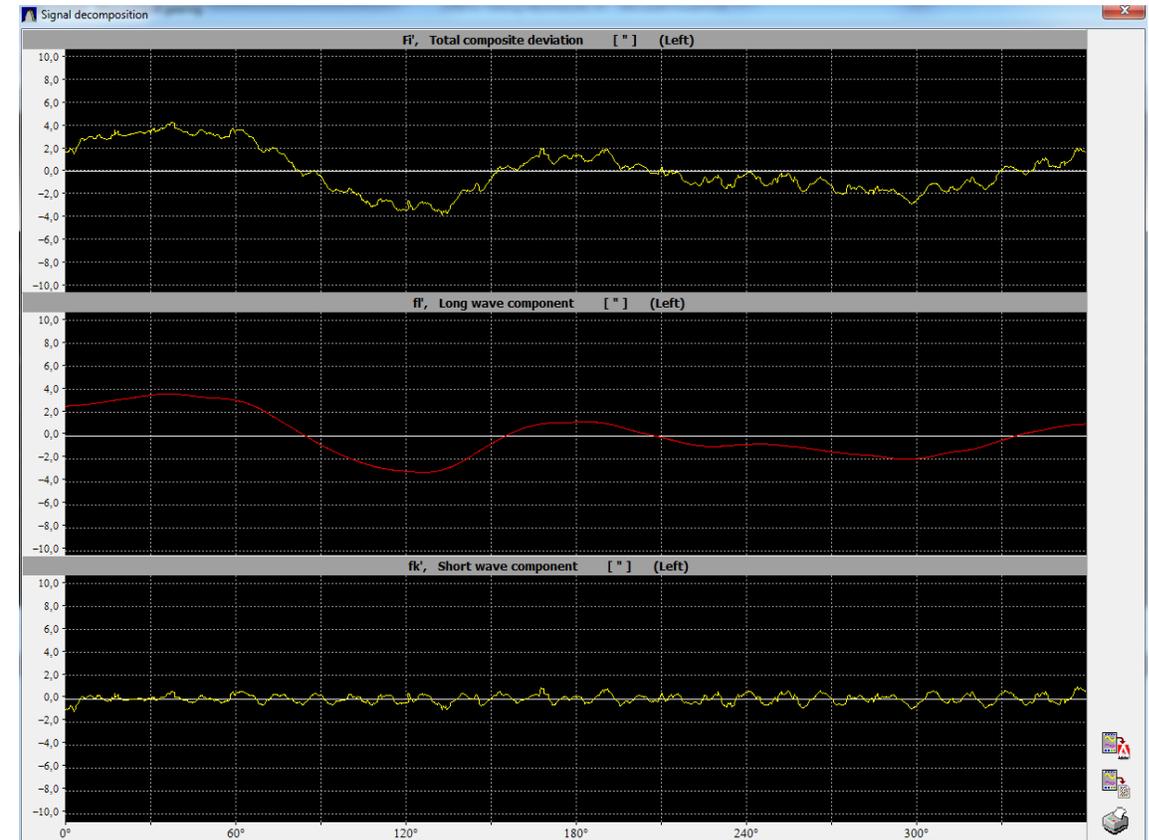

➤ Machine is **not good**
➤ Too big runout (wrong assembly?) and damage

Measuring software – examples of charts

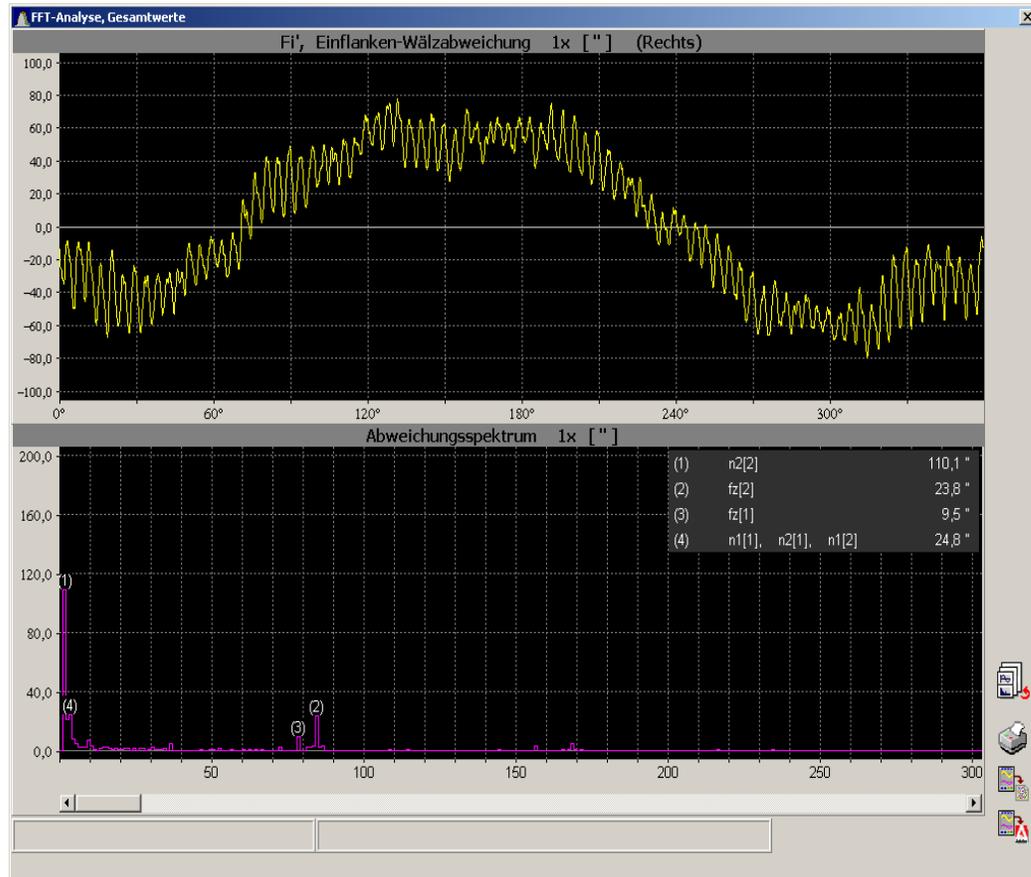

➤ Machine is **good**

➤ Runout and **roundness** are too big

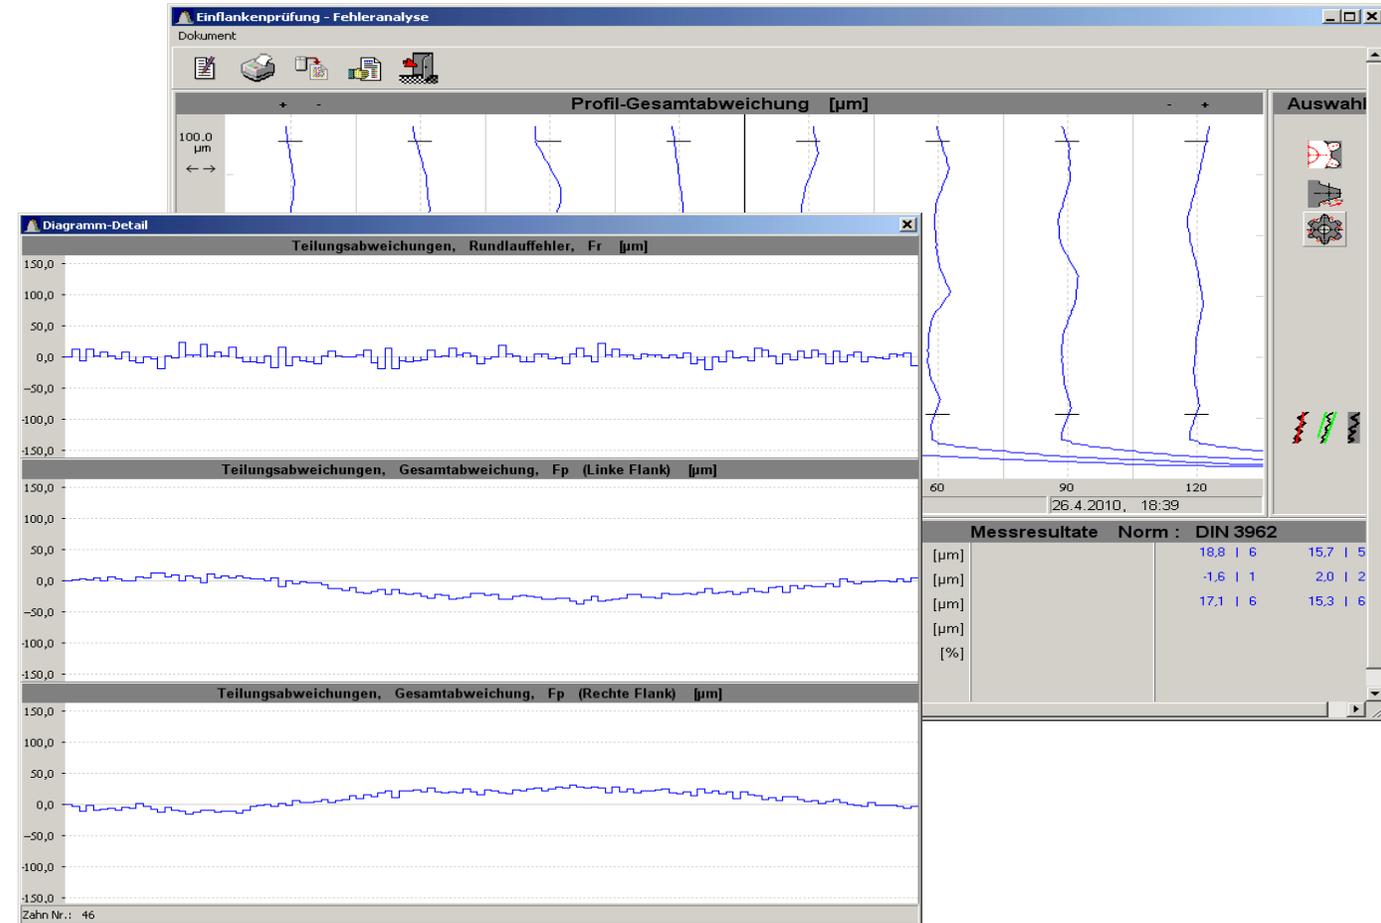

➤ **Can be** subsequently mathematically **eliminated**

Measuring software – examples of charts

➤ FFT analysis of measured data

Mathematical simulation of quality

Control computer

It is based on high performance military computer

Measuring cards by Heidenhain

Control I/O cards by Advantech for communication with proper hardware - optional

GTM instrument contains

Special industrial computer

including measurement cards

Precision rotary sensor head

for measurement of transmission error, 2 pcs

Precision linear sensors, 2 pcs

for measurement of table stability, 2 pcs

Measuring software

Expert-system for gear hobbing machines

Installation, customer training
